

PROJECT CASE STUDY
Hybrid Modeling
for Energy Efficient
CNC Grinding

**Smart Manufacturing software
drastically improves
efficiencies in energy-
intensive gear manufacturing**

PROJECT LEAD

West Virginia University

PROJECT TEAM

Indiana Technology and
Manufacturing Companies
(ITAMCO), University of Buffalo

PROJECT OBJECTIVE

The principal goal is to reduce the extremely high energy consumption of grinding processes for gear manufacturing by at least 15% through hybrid modeling of the grinding system holistically.

BENEFITS TO OUR NATION

The US demand for gears is expected to grow by 6.4% to \$40 billion in sales. Grinding will remain the core technology to produce large-scale, high-quality gear components. The novel, scalable, and generalizable hybrid modeling approach and its deployment in the CESMII Smart Manufacturing Innovation Platform (SMIP) environment will provide a blueprint for other manufacturers to reduce the energy consumption of the US grinding industry.

BENEFITS TO INDUSTRY

The project showcases rapid recovery of Smart Manufacturing adoption cost through energy savings and productivity increases in an industry with energy intensive processes. The project creates an opportunity to scale its impact for other interested CESMII members across industries (automotive, aerospace, medical, etc.) and applications (milling, turning, etc.) within the larger CESMII network.

PROJECT DESCRIPTION

TECHNICAL APPROACH

Develop novel hybrid modeling methods that combine multi-physics equation-based models with data-driven machine learning models.

The hybrid model's output provides grinding process parameters (e.g., wheel speed, depth of cut, infeed duration) as well as grinding tool reconditioning schedule and parameters (dressing and sharpening) that reduce the overall grinding system's specific energy consumption. The model will be prototypically implemented in the industrial testbed and located on-premise at ITAMCO, a leading US gear manufacturer.

ACCOMPLISHMENTS

- Created a unique hybrid model to optimize the grinding process energy consumption combining the physics model with the Deep Neural Network (DNN).
- Validated a hybrid model approach based on quantitative analysis of the physics model assumptions and boundary conditions. Pushing limits within boundary conditions can aid optimization.
- The pretrained hybrid model is used to develop a Jupyter Notebook that can now easily acquire minimal grinding time/energy usage with the optimal grinding settings.
- Developed a white paper that will serve as a practical guide on developing hybrid models for manufacturing use cases and disseminated the project at IMTS, NAMRC, INFORMS etc.

DELIVERABLES

- Delivered complete data model template for machine tool messages
- Collected and validated grinding manufacturing process sample data set
- Documented generalized hybrid model for grinding
- Documented development framework for hybrid model
- Hybrid model Smart Manufacturing App source code submitted to CESMII GitHub repository
- Functional Hybrid model Smart Manufacturing App implemented at ITAMCC

REUSABLE OUTCOMES / SM MARKETPLACE

- Smart Manufacturing profile for CNC grinding.
- Data-driven and physics-based predictive models for CNC grinding.
- Hybrid model analytics for generic grinding applications.

RESULTS

↓ 41%

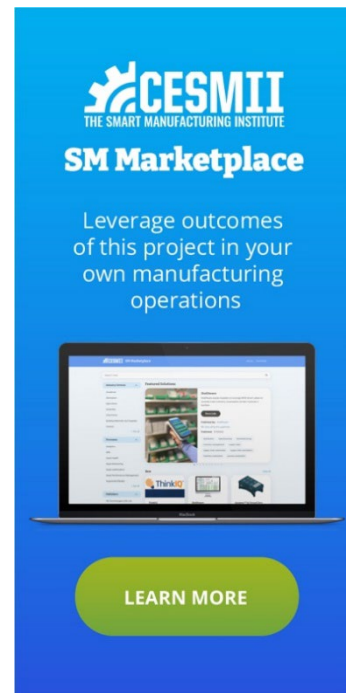

Decrease in processing time equal to 222 min per part with potential to save \$107K per year.

↑ \$6.9k/yr

\$6.9 k potential savings with a 37% decrease in energy consumption per year.

↑ \$107k/yr

Potential cost savings per manufactured part due to decrease in part processing time.

The banner features the CESMII logo at the top, followed by the text 'SM Marketplace'. Below this, it says 'Leverage outcomes of this project in your own manufacturing operations'. In the center is an image of a laptop displaying a software interface. At the bottom is a green button with the text 'LEARN MORE'.

PROJECT DETAIL

Budget Period: BP4 – BP5
Submission Date: 01/15/2023
Sub-Award (contract) Number:
4550 G YA103
SOPO: 2313
